MMF EXECUTION CHECK — RAISED 21 SEPTEMBER 2026, CLOSED 1 OCTOBER 2026

Board seat: COO (execution) | **Trigger:** scheduled task, one-off **Status: EXECUTED.** ₦5,000,000 deposited into the Coronation Money Market Fund, confirmed 1 October 2026. **Elapsed:** 13 days from decision to execution. Seventeen days inside the thirty-day sprint window.

1. RESULT

Field	Confirmed
Fund	**Coronation Money Market Fund**
Amount	**₦5,000,000 — the full committed amount**
Source	Piggyvest (₦8,000,000 → ₦3,000,000 residual)
Confirmed	1 October 2026
Yield at decision	20.54% YTD (Q3 2026)
Management fee	1.50%
Redemption	24–48 hours, no penalty

Reconciliation baseline — the board's original ask was wrong and is corrected here. The board asked for unit price / NAV at purchase. **No such figure exists.** This is a constant-price fund: returns arrive as income credited, not as a rising unit price. The board was applying an equity-fund reconciliation to a cash-fund product. The client ID request is **withdrawn** — an access identifier has no business in a project document.

Correct method: opening balance and date against income credited per statement period. Realised yield = income ÷ average balance, annualised, against the 20.54% quoted. **Outstanding: the first statement.**

2. WHAT THE DEPOSIT BOUGHT — AND WHAT IT DID NOT

Yield: ₦527,000/year. Piggyvest at ~10% against 15.91% inflation is roughly −6% real. Coronation at 20.54% is roughly +4.6%. **Runway: unchanged.** ₦5m at 48 hours plus ₦3m in Piggyvest is still ₦8m inside two business days. **Concentration: unchanged, by 0.00pp.** A reallocation between two **non-Odion** assets leaves numerator and denominator untouched.

Board error recorded (B2). The board presented that third point as a correction, assuming he had mistaken a yield win for a risk win. He had not. His stated objective was capital efficiency — "*making better financial decisions as the options open up to me*" — not de-concentration. The board graded the decision against an objective he had not invoked, and spent his attention explaining a point he already held.

What survives as a finding: **the sweeps and the Lokoja sale are now the entire active de-concentration engine.**

3. THE COLLISION FLAGGED ON 21 SEPTEMBER — CLOSED BETTER THAN PROPOSED

The board flagged that the ₦5m transfer and the Dangote IPO's second ₦500,000 tranche both drew on the same ₦8m balance, leaving ₦2.5m against a stated ₦3m buffer immediately before the December–March rent gap. The board assumed the resolution would be accepting a smaller buffer.

He resolved it differently and better: he changed the tranche's funding source to the monthly Odion returns and left the ₦3m buffer whole. Recorded as **E1**. Counterweight: the chosen source re-routed the cost into Rule 1 rather than removing it — the subject of §4.

4. RULE 1 v1 → v2 — THE REWRITE THIS CHECK PRODUCED

4a. There is only one surplus stream. Odion ₦2,100,000 + rent ₦91,666 − burn ₦1,250,000 = **~₦941,666/month.** "From Odion returns" and "from the monthly surplus" are the same money by a different route. The month the tranche goes in, the sweep is **~₦440,000 instead of ~₦940,000.**

4b. Why v1 was retired rather than patched. He established the governing principle unprompted: **surplus will not always serve de-concentration, because life events exist.** A rule known in advance to be unkeepable does not produce compliance — it trains the habit of quiet breach and takes the credibility of every neighbouring rule with it. Logged as **BP1**.

4c. The measurement error v1 contained. The clock depends on surplus entering the **non-Odion financial asset base**, not the MMF. ₦500,000 into NGX equities advances it exactly as fast. v1 was pointed at the wrong variable.

4d. A board error caught on review (B4). The board first offered a Channel A cap of "20% of **monthly** surplus" — ₦188,333 — to accommodate a ₦500,000 tranche. **It would have been breached on first use.** Opportunities are lumpy; the budget for them must be too. The cap is annual.

4e. Rule 1 v2, ratified 1 October 2026 — Clause 1 Odion floor (absolute) · Clause 2 default to MMF · Clause 3 Channel A, 20% of annual surplus, clock-neutral · Clause 4 Channel B, uncapped suspension with a soft trigger at ₦941,666, clock-stretching · Clause 5 review.

The soft trigger was his choice over a hard cap, in his words "*that way the rules are not violated easily.*" Recorded as **E3**: offered the easier design and the more constraining one, he chose the one that binds him harder.

Recorded dissent (§3.2). The CRO objects that an uncapped Channel B is unfalsifiable — any diversion can be relabelled a life event. The objection is sound and was not dismissed. The decision goes against it because a capped emergency clause is breached in the first real emergency and takes the rule's credibility with it. The objection converts into the soft trigger, the logging duty, the December reconciliation, and the written three-question test.

5. SPRINT STATUS — OBJECTIVE 1 CLOSED

KR	Status
KR1.1 Coronation MMF account opened	Confirmed 1 Oct 2026
KR1.2 ₦5,000,000 transferred	Transferred. First statement outstanding
KR1.3 Standing rule activated	Rule 1 **v2** ratified and active

Objective 1 closed 17 days early. **Objective 2 (title chain) is now the critical path, and it gates the Lokoja sale — the highest-value single decision in the file.**

The deposit is confirmed by David, not independently verified by the board.
