Personal Board of Directors — Four-Seat Memorandum (v2)

Subject: Dangote Refinery IPO allocation (₦500k–₦1M) · Decision owner: David
v2, 13 September 2026 · Companion to IPO Research Brief v2 · v2 changes: p.65 closed, USD quotation, drawdown base rate

Purpose and standing

This memorandum is separate from the IPO research brief by design. The brief answers *what the asset is worth and under which scenarios*. This memo answers *what the decision means for your balance sheet, your risk rules, your calendar, and your decision process*. It should be read after the brief and before the app is opened.

Facts about your position used here are the ones you stated in this conversation and in the Phase 1 intake: ₦500,000 already in the Hisa wallet, ring-fenced for this offer and not drawn from the ₦8m Piggyvest balance; a second ₦500,000 would come from Piggyvest; you determine size and timing after reading the report. Nothing below is a licensed recommendation; it is the board's position, with reasons, for you to accept or overrule.

Seat 1 — Strategic Wealth/Asset Advisor (chair for this item)

Position: the offer is fairly priced only under the bull scenario; the base case implies a fair value materially below ₦525; the balance sheet is sound; the float is scarce. Detail is in the brief.

What the seat adds beyond the brief — portfolio fit. As of the Tier-1 core, ~94% of your net worth is naira-denominated, ~48% sits in two inherited flats yielding under 1%, and 71% of financial assets and 100% of income run through one counterparty. The prospectus discloses that DPRP shares will be **quoted on the NGX in US dollars and settled in naira** (p.181). That makes the position a dollar asset held through a naira wallet — the one attribute your balance sheet lacks, delivered mechanically rather than through an earnings-translation argument. It is a real diversification case, and it is also the exact story the offer is being sold on, so the seat weights it at about two-thirds of what it feels like: the currency works; the business still has to.

Sizing view. ₦500k is 0.14% of stated net worth (~₦350m) and 6.25% of naira liquidity (₦8m). ₦1m is 0.29% and 12.5%. Neither is large in net-worth terms. The constraint is liquidity, not exposure, and that is the CRO's and COO's territory.

Recommendation to the board: Tranche 1 at ₦525 from the Hisa ₦500k, sized to what you would hold through a **35–50% dollar-terms drawdown** — the historical base rate for Nigerian public offers in Brief §6, not the 30% v1 used; second ₦500k held in a money-market instrument with written triggers, not deployed at the offer.

Seat 2 — Chief Risk Officer

The CRO does not assess the refinery. The CRO assesses the position against your own rules.

1. Source of funds test. The Hisa ₦500k was set aside before this analysis and outside the ₦8m runway. It passes: it is already allocated risk capital, and deploying it changes nothing about runway. The second ₦500k fails the test *as of today*: it would come from the ₦8m that the board recorded as 6.4 months of liquidity against a burn of ₦1.25m/month, with an unbudgeted rent gap starting December 2026 and renovation capex sitting on a property whose title is unperfected. Drawing it takes runway to ~6.0 months during the month the gap opens.

2. Concentration test. The standing finding is that the portfolio's problem is concentration in a single private lender and in dead property, not too little equity risk. Adding ₦500k of listed equity does not worsen concentration; it marginally improves it. The CRO has no objection on concentration grounds to either ticket.

3. Sizing rule consistency. In the prop account you risk 0.25% per trade and have held that discipline since November 2025. A ₦500k position with a 45% adverse scenario (the mid-point of the Brief §6 base rate) is a ₦225k risk — 2.8% of naira liquidity, 0.06% of net worth. Consistent with how you size elsewhere. A ₦1m position with the same adverse scenario is ₦450k — 5.6% of naira liquidity in the month the rent gap opens. Not inconsistent with your stated tolerance, but it is the larger draw at the worse moment, and the base rate is worse than v1 assumed.

4. The Van Tharp test. You cited Tharp on the HRT account; it applies here. The offer is structured — 30-day window, "IPO for the people", loyalty bonus, founder narrative — to make the decision feel time-bound and identity-linked. Tharp's finding is that positive-expectancy participants go bust by over-betting under exactly that pressure. The CRO's rule: no allocation

decision is made inside the app. The number is written here, first.

5. Kill criteria (pre-committed). Position is reviewed for exit, not merely for not-adding, if: FY2026 results show H2 GRM below $15; export restrictions or gantry price caps are imposed; the related-party derivative recurs in FY2026 without disclosure of terms; the USD dividend is formally refused *and* the price is above ₦525 (take the exit the scarcity gives you).

CRO verdict: No objection to Tranche 1 from the Hisa ₦500k. **Objection** to drawing the second ₦500k from the ₦8m before (a) the money-market move the board mandated is executed, (b) the rent-gap months are funded, and (c) a Tranche 2 trigger from the brief has actually fired. The objection lapses if any of the following happen: Odion pays as scheduled through December and January, the rent gap proves shorter than modelled, or the Apo/short-let plan removes the renovation capex from your side of the ledger.

Seat 3 — Chief Operating Officer

The COO's question is sequencing, not merit.

Calendar collision. Listing is indicatively 2 December 2026. The Abuja tenant vacates November–December; the rent gap runs to March–April 2027; renovation capex lands in the same window. Tranche 2 triggers in the brief also fall in months 1–6 post listing — December to May. Every cash demand you have is scheduled for the same quarter.

Sequence the board can execute this month:

Order	Action	Owner	Deadline	Why first
1	Write the position size and the Tranche 2 triggers on one page; sign it	You	Before 14 Sep app opens	Pre-commitment beats willpower (Psychologist)
2	Execute the ₦8m Piggyvest → money-market fund move the board mandated	You	This week	Raises yield on the runway pool from savings rate to ~17–20% while T-bills are still above 16%; it is where any Tranche 2 cash should sit anyway
3	~~Confirm p. 65 with Hisa~~ **Closed**: entitlement is one share per investor per period, regardless of shares held (prospectus p.65); approvals still pending	Board	Done	No open fact remains that changes Tranche 1 sizing
4	Apply Tranche 1 through Hisa in one application, multiples of 10	You	Any day before 13 Oct — there is no advantage to day one	Full-allotment threshold makes timing inside the window irrelevant
5	Diary: Q3 results (~Nov/Dec), listing (~2 Dec), MPC (21–22 Sep), FY2026 results (~Mar 2027)	Board	Standing	These are the Tranche 2 gates
6	Rent-gap funding plan closed before any Tranche 2 draw	You	Nov 2026	CRO condition

Life-KPI note. The 2026 World Cup has concluded; no collision between the offer window and stated personal priorities is visible to the board. Sarah's copywriting pipeline is an unquantified income line the board still cannot see; it would change the CRO's runway maths if it is real and recurring.

Seat 4 — Performance Psychologist

The Psychologist has no view on refineries. The Psychologist has a view on how this decision is being framed for you, and on the two patterns already on file that it targets.

Framing analysis. The offer's packaging — "IPO for the people", a founder with a national-hero narrative, a ₦5,250 entry, a loyalty bonus that is 20% for the smallest buyer and 0.1% for you, a 30-day fixed window, sell-side fair values 12–30% above the offer from the offer's own issuing houses — is a coherent design. It converts a valuation question into an identity and belonging question. Nigerian commentary has already reached for the SpaceX-retail analogy. None of this is evidence the asset is bad. It is evidence that the decision environment is engineered, and engineered environments are where stated

principles lose to revealed behaviour.

Pattern P1 — stated-vs-revealed gap. On file: you affirmed passive de-concentration and then added ₦15m to Odion in the same message when a trusted call arrived. Mechanism: speed. The IPO is a slower, weaker version of the same mechanism — a trusted brand rather than a trusted person, a 30-day window rather than a phone call. The remedy class is unchanged: **the number is decided before the stimulus, in writing, with the triggers for changing it.** You have already agreed to this. The Psychologist's job is to note that agreeing to it and doing it are different observations, and the second is the one that gets scored in March 2027.

Pattern P5 — relationship-as-collateral. On file: Odion risk accepted on 15-year personal trust. The IPO's analogue is reputation-as-collateral: the founder's record standing in for due diligence. Your instinct was correct here — you asked for the prospectus to govern, and it did. Record that as a counter-observation to P5 in the March assessment.

Empowering observations from this cycle. You supplied the Gemini brief and asked for it to be expanded, then accepted that three of its numbers were wrong without defending them. You asked for the disconfirming check before the bonus question was answered. You separated the ₦500k already committed from the ₦500k that is not. These are the behaviours the board wants to see more of, and they should be in the memory core as observed, not inferred.

One commitment device. Before opening Hisa on or after 14 September, write and date one sentence: *"My Tranche 1 is ₦_____. I will not change it inside the app. Tranche 2 requires trigger _____ from the brief."* Photograph it. That is the whole intervention.

Board resolution

Item	Resolution	Dissent
Tranche 1 from Hisa ₦500k	Board supports, sized to a 30% drawdown you would hold through	None
Second ₦500k from Piggyvest at the offer	**Board does not support** at this time	Wealth Advisor notes the scarcity prior could make this the cheaper entry; accepts the CRO's liquidity objection as decisive for a December draw
Second ₦500k via Tranche 2 triggers, from a money-market pool, after the rent gap is funded	Board supports	None
Money-market move of the ₦8m	Reaffirmed; execute this week	None
Pre-commitment in writing before the app	Required	None

Decision owner: you. The board has stated its position and the conditions under which each seat would change it.

Memory-core delta (for the Tier-1 update at next milestone)

- [stated] ₦500,000 held in Hisa wallet, ring-fenced for the Dangote Refinery IPO; not part of the ₦8m Piggyvest liquidity.
- [stated] Any second ₦500,000 for the IPO would be drawn from the ₦8m Piggyvest balance.
- [stated] Position size and timing to be decided after reading the board report; agrees to fix size before opening the app.
- [stated] Prospectus governs over prompt inputs on conflict.
- [stated] Supplied the full prospectus; prospectus governs on conflict.
- Research mandate additions: track H2 2026 GRM at FY2026 results (~Mar 2027) against the issuer's own $24.2 guidance; track NNPC naira-crude cargoes/month; MPC 21–22 Sep outcome for the money-market move; observe how the USD-quoted share actually trades on the NGX in month one; FY2026 disclosure of the intercompany derivative and the $414m related-party receivable; whether the Incentive Programme approvals (shareholders, SEC, OGFZA, NGX) are obtained.
- Closed: p.65 per-investor clause; net debt ($1.40bn, cash $4.27bn); Gemini's 0.27x and 3.9x figures confirmed correct, v1's rejection of them withdrawn.
- Biannual assessment (March 2027) to score: did Tranche 1 match the pre-written number; did any Tranche 2 draw follow a written trigger; P5 counter-observation recorded.
